Guidance Modal

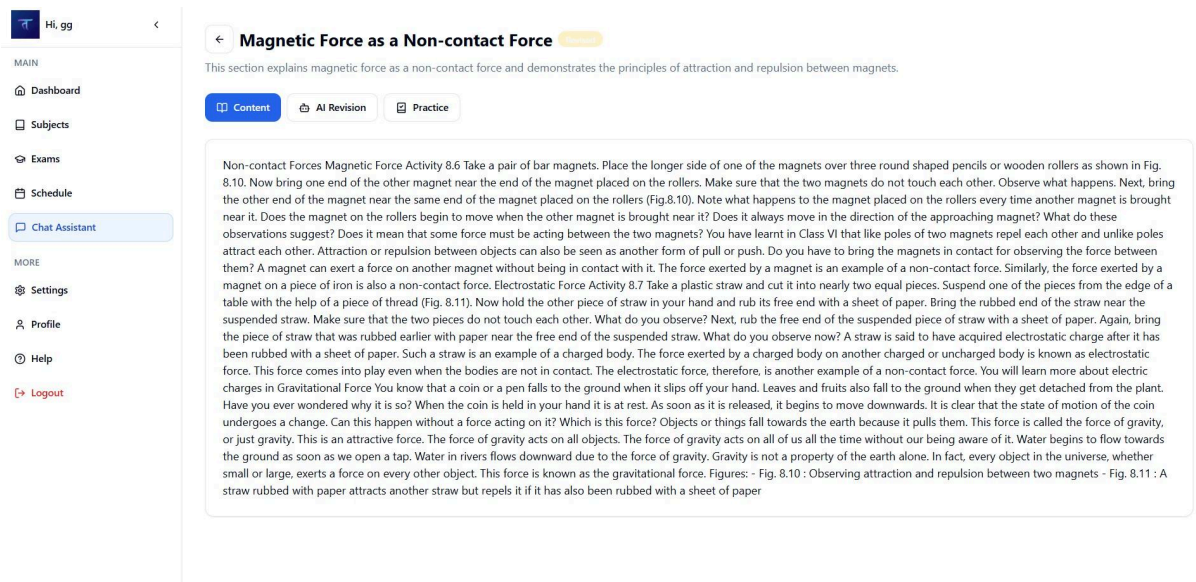
There is a slight delay when opening the guidance modal. The animation also feels somewhat distracting and could be smoother or toned down. Overall, the interface could use refinement, as it currently feels plain and not very engaging.

When I clicked on a topic inside the guidance modal, it redirected me to a 404 page. The console displayed the following error:

Failed to load resource: net::ERR_FAILED
404 Error: User attempted to access non existent route:
/topic/5ed9190a-4389-46b5-a86e-35bbda30858c/practice

Topic Section

The content formatting in the topic section could be improved. At the moment, it feels dense and would benefit from clearer structure, better spacing, and stronger visual hierarchy to make it easier to read and follow.



AI Revision

I encountered an error when trying to send a message:

[useRevisionChat] Error sending message:
Error: Session not initialized. Please start a revision session first.

In addition, the chat window is quite small, which makes longer revision sessions slightly uncomfortable and limits usability.

Interaction Issues

There appears to be a small but confusing bug related to button interactions. For example, after pressing the Check Understanding button and receiving a question, if I scroll up and select an option from a previous question, that selection is applied to the most recent question instead of the original one. This creates confusion and affects the overall experience.

Practice Page

The feedback and explanation text on the practice page is quite small and not very easy to read. Increasing the font size and improving the layout would make it more accessible and comfortable to engage with.

Help Page

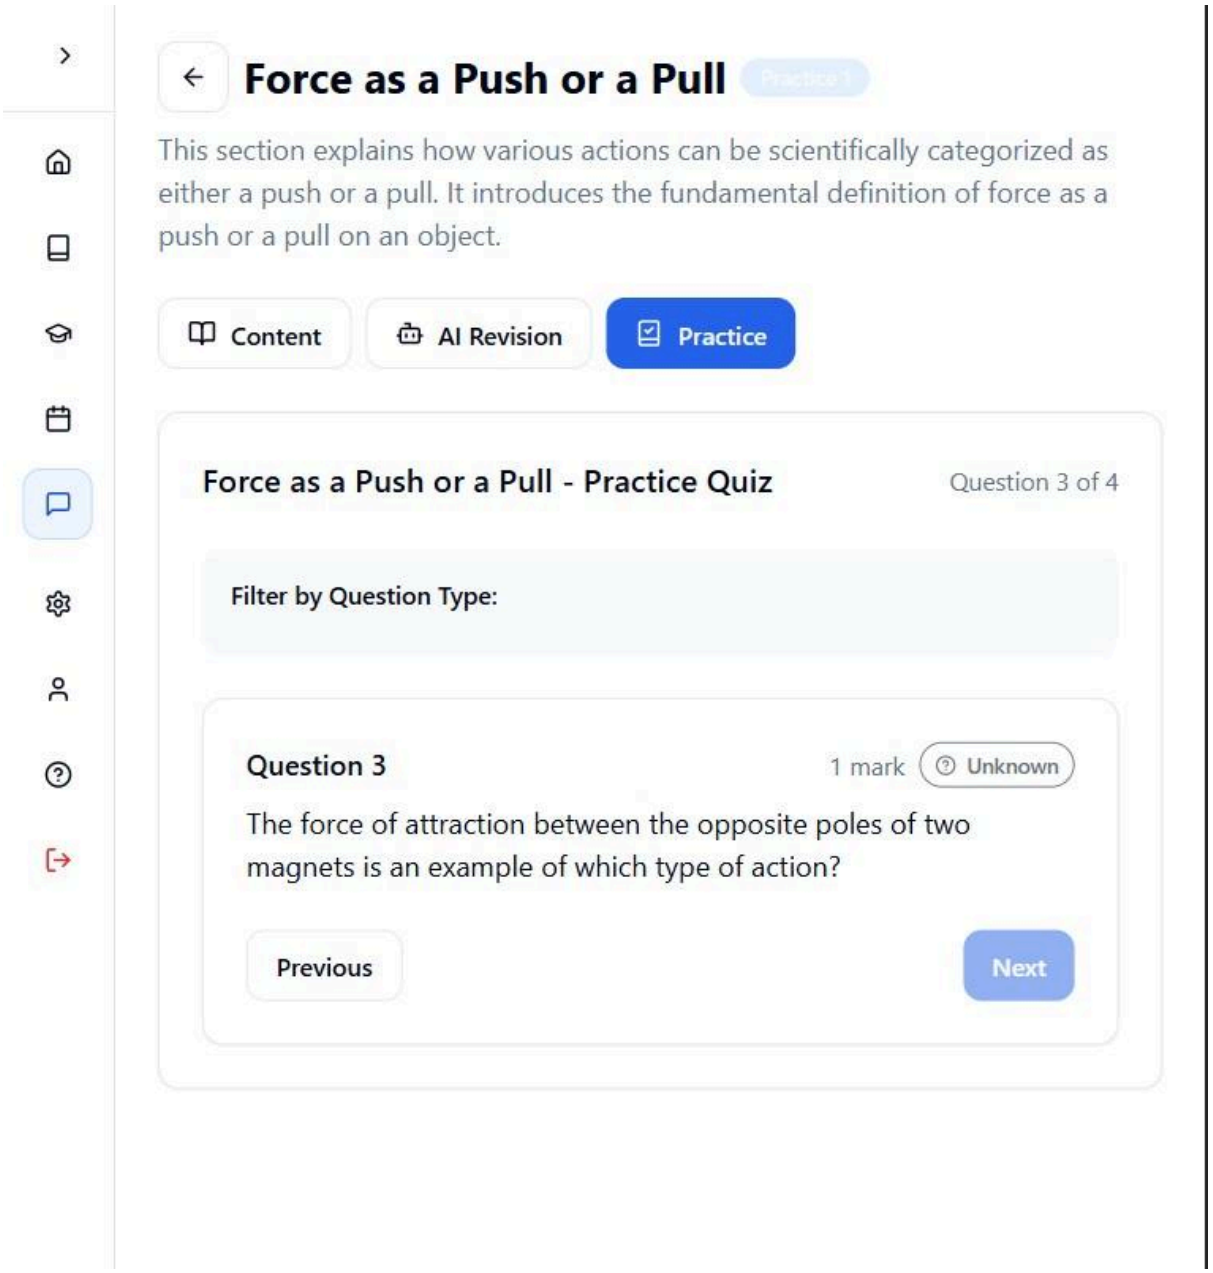
The help page currently returns a 404 error.

Overall Thoughts

As a student and someone from Gen Z, I genuinely believe the UI and UX could be strengthened. The current design feels somewhat generic and bland, and at times resembles an automatically generated interface rather than something carefully crafted. Developing a more distinctive and intentional visual identity would make the platform feel more polished and memorable.

There are also several small bugs and usability issues that, while not critical individually, collectively impact the overall experience. Many of these seem like quick improvements that could significantly enhance how refined and reliable the product feels.

Small details matter, especially for younger users. Attention spans are short, and users tend to disengage quickly if something feels slow, confusing, or visually uninteresting. Even minor friction points can influence how long someone chooses to stay on the platform.

It may also be worth considering thoughtful gamification elements to improve retention. Features such as progress tracking, streaks, rewards, levels, or interactive challenges could make the learning experience more motivating


and dynamic. If implemented carefully, this could increase engagement without compromising educational value.
